# EXPLORING HIGH PERFORMANCE STORAGE WITH DAOS

Kenneth Cain Mohamad Chaarawi Johann Lombardi

Adrian Jackson
(a.jackson@epcc.ed.ac.uk)
Nicolau Manubens

#### Aims

- Understand object storage hardware and software
- Learn about DAOS and filesystems on DAOS
- Learn about DAOS lower-level APIs and using them for your applications
- Get hands on with DAOS and high performance storage hardware
- Learn how to program, and design, for object storage systems

#### Aims cont.

- Understand/think about your application data requirements
  - Both storage and discovery
- Thinking about different ways you undertake I/O or storing data
- Move beyond bulk, block-based, I/O paradigms

#### Format

- Lectures and practicals
- Slides and exercise material available online:
  - https://github.com/adrianjhpc/ObjectStoreTutorial
  - Exercises will be done on remote system (NEXTGenIO)
  - We will provide access for these

#### Timetable

- o8.30 Introduction
- o8.40 Object storage and storage approaches
- o9.20 Practical: Benchmarking different storage approaches
- o9.30 DAOS programming APIs
- 10.00 Break
- 10.30 DAOS programming APIs, filesystems, and examples
- 11.30 Practical: Using DAOS for applications
- 11.50 Performance, design, and summary
- 12.00 Finish

## Object Storage

- Design and performance considerations are the challenge
  - Programming against the interfaces is (relatively) easy(ish)
  - Direct use often straight forward (i.e. filesystem interfaces)
  - More intelligent functionality takes more work/more specialised
- Design for functionality
  - When to store, when transactions should happen, what granularity I/O operations should be, what failures can you tolerate, etc..
- Design for performance
  - Memory size, I/O, data access costs, etc...

## Object storage

- Data stored in unstructured objects
  - Data has identifier
  - Size and shape can vary
  - Metadata can also vary
- Originally designed for unstructured data sets
  - Bunch of data with no specific hierarchy required
- Can also enable efficient/fast access to data in different structures
  - Supports different creation, querying, analysis, and use patterns

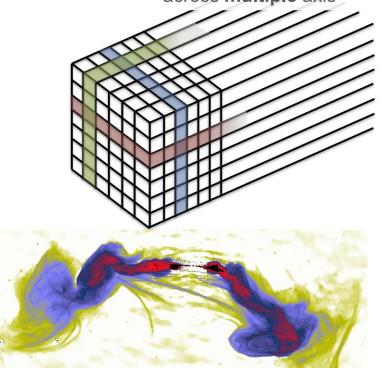

## Object storage

- Can enable efficient/fast access to data in different structures
  - Supports different creation, querying, analysis, and use patterns
- Granular storage with rich metadata
  - Data retrieval leverages metadata
  - Build structure on the fly
- Weather/climate
  - Pursuing optimal I/O for applications
    - Weather forecasting workflows
  - End-to-end workflow performance important
  - Simulation (data generation) only one part
    - Consumption workloads different layout/pattern from production
- Radio astronomy
  - Data collected and stored by antenna (frequency and location) and capture time
  - Reconstruction of images done in time order
  - Evaluation of transients or other phenomenon undertaken across frequency and location

Clients want to do **different** analytics across **multiple** axis

### Summary

- Please don't hesitate to ask questions!
- We have a practical sessions
  - Login account will remain active for you to try out using DAOS after the tutorial (not really enough time to finish them during the tutorial today)
  - Email <u>a.jackson@epcc.ed.ac.uk</u> to get an account on the system we will use for practical/try out sessions (if you use the subject "Object store account" that will help us respond to the emails)
